

Introduction

Web development is the process of building and maintaining websites. It involves creating everything that makes a website work, look good, and provide a smooth user experience.

There are two main parts:

- **Frontend (Client-side)** – What users see on their screens (HTML, CSS, JavaScript).
- **Backend (Server-side)** – Handles data, databases, and server logic (Python, PHP, Node.js, etc.).

A web developer combines design and programming to make websites functional, interactive, and visually appealing.
